1. Python Language is created by Guido van Rossum. He has worked on Python for 25 years.

For more info, visit `www.python.org`

2. Python was named "Python" for Monty Python's Flying Circus, not because it's a snake. And the reason was that Guido was trying to capture an air of play.
3. check the python version using `python3 --version` on mac and on windows, use `py --version` for checking python version and `py` command for various python commands.
4. You can't other than letters and numbers in variable names. Like `var.12` is illegal but `var_12` is legal. `_spam` is fine but `#spam` and `23spam` are illegal.
5. mnomonics variable means we choose the variable names that make sense and are easy to remember and understandable by humans.
6. We need remainder operator `%` to put output in a certain range, for example, playing cards or dice to get a number between 1 to 6.

TOPIC 7

Operator precedence rule (High to Low) in python

- Parentheses
- Exponentiation
- Multiplication and division and remainder
- Addition and subtraction
- Left to Right evaluation in case of same precedence

8. In python 2, 9/2 = 4 but in python 3, 9/2 = 4.5. In python 2, 9//2 = 4 but in python 3, 9//2 = 4.0
9. In case of if-elif-else block. exactly one block out of if, elif and else block should be executed.

In case of if-elif block with no else block, either if or elif block should be executed or no block should be executed.

10. In Try-Except block, if something goes wrong in try block then it exits the try block where something goes wrong and goes to except block and executes the statements.
11. For reuse or D.R.Y(Don't Repeat Yourself), we use functions.
12. `in` keyword is similar to `belongs to` symbol in math.
