

TOOLS

DBeaver

Source: Notes.md

1. Create a Connection to the database:

A. Open DBeaver B. Click on New Connection Wizard button on the toolbar C. Select your database. DBeaver supports lots of databases. Here we will connect to a Postgres database.

DBeaver is just a client; it cannot work unless a PostgreSQL server is installed and listening on port 5432. So, first install postgresql then make connection and test connection and then finish it.

2. Now, to write SQL queries, click on the SQL editor button at the top. Write the query and run it.

```
create table mytable ( somevalue varchar(20) );
```

```
insert into mytable(somevalue) values ('Hello');
```

```
select * from mytable;
```

3. We can create multiple tabs for writing SQL scripts from the top SQL dropdown menu.
